EXP NO: 1	AZURE DEVOPS ENVIRONMENT SETUP
------------------	---------------------------------------

Aim:

To set up and access the Azure DevOps environment by creating an organization through the Azure portal.

INSTALLATION

1. Open your web browser and go to the Azure website: <https://azure.microsoft.com/en-us/get-started/azure-portal>.

Sign in using your Microsoft account credentials.

If you don't have a Microsoft account, you can create one here: <https://signup.live.com/?lic=1>

2. Azure home page

3. Open DevOps environment in the Azure platform by typing *Azure DevOps Organizations* in the search bar.

4. Click on the ***My Azure DevOps Organization*** link and create an organization and you should be taken to the Azure DevOps Organization Home page.

Result

Successfully accessed the Azure DevOps environment and created a new organization through the Azure portal.

EXP NO: 2	AZURE DEVOPS PROJECT SETUP AND USER STORY MANAGEMENT
-----------	---

Aim:

To set up an Azure DevOps project for efficient collaboration and agile work management.

1.Create An Azure Account

2.Create the First Project in Your Organization

- After the organization is set up, you'll need to create your first **project**. This is where you'll begin to manage code, pipelines, work items, and more.
- On the organization's **Home page**, click on the **New Project** button.
- Enter the project name, description, and visibility options:
 - Name:** Choose a name for the project (e.g., **LMS**).
 - Description:** Optionally, add a description to provide more context about the project.
 - Visibility:** Choose whether you want the project to be **Private** (accessible only to those invited) or **Public** (accessible to anyone).
- Once you've filled out the details, click **Create** to set up your first project.

Create new project

About this project Like 0

Project Description – Weather Application

The Weather Application is a user-friendly web-based system designed to provide real-time weather information for any location. The application allows users to search weather details by city name or automatically detect their current location to display accurate weather conditions.

The system retrieves live weather data from an external Weather API and presents key information such as temperature, humidity, wind speed, and weather conditions in a clear and visually appealing interface. It also provides a 5-day weather forecast to help users plan their daily activities effectively.

The application is developed with a focus on simplicity, performance, and usability, ensuring quick response time and smooth user interaction. Proper error handling mechanisms are implemented to manage invalid inputs and network issues gracefully.

Overall, this project demonstrates the use of modern web technologies, API integration, and Agile project management practices using Azure DevOps for efficient planning and development.

Project stats Period: Last 7 days

Boards

- 10 Work items created
- 0 Work items completed

Repos

- 0 Pull requests opened
- 0 Commits by 0 authors

Pipelines

- 100% Builds succeeded

Members 4

LS LS JS JJ

5. To manage user stories:

a. From the **left-hand navigation menu**, click on **Boards**. This will take you to the main **Boards** page, where you can manage work items, backlogs, and sprints.

b. On the **work items** page, you'll see the option to **Add a work item** at the top. Alternatively, you can find a + button or **Add New Work Item** depending on the view you're in. From the **Add a work item** dropdown, select **User Story**. This will open a form to enter details for the new User Story.

Result:

Successfully created an Azure DevOps project with user story management and agile workflow setup.

EXP NO: 3

SETTING UP EPICS, FEATURES, AND USER STORIES FOR PROJECT PLANNING

Aim:

To learn about how to create epics, user story, features, backlogs for your assigned project.

Create Epic, Features, User Stories, Task

The screenshot shows the 'Weather App Team' backlog in Azure DevOps. The interface includes a left sidebar with navigation options like Overview, Boards, Work Items, Backlogs, Sprints, Queries, Delivery Plans, Analytics views, Repos, Pipelines, Test Plans, and Project settings. The main area displays a table of work items:

Order	Work Item Type	Title	State	Eff
1	Feature	City Search Feature	Resolved	
	User Story	view weather by city name	Resolved	
2	Feature	Current Weather Display	Resolved	
	User Story	View current weather details	Resolved	
3	Feature	Weather Forecast Feature	Resolved	
4	Feature	Location-Based Weather	Resolved	
5	Feature	Error Handling & Alerts	Resolved	
	User Story	Handle invalid city input	Resolved	
6	Feature	User Interface & Experience	Resolved	
	User Story	Display user-friendly interface	Resolved	

On the right, the 'Planning' pane shows a 'Weather App Team backlog' and a 'Sprint 3 - UI and Final Touches' with a planned effort of 3. Below the sprint, there are sections for 'Iteration 1' and 'Iteration 2', both indicating 'No work scheduled yet'.

1.Fill in Epics

The screenshot shows the 'Weather Information Management' epic detail page in Azure DevOps. The page is titled '1 Weather Information Management' and is owned by 'Lokshana Senthilkumar'. It includes a 'Description' section with the text: 'As a user, I want to view accurate and real-time weather information so that I can plan my daily activities accordingly.' Below the description is a 'Discussion' section with a comment box and a 'switch to Markdown editor' link. The right sidebar contains several panels: 'Planning' (with fields for Priority, Risk, Effort, Business Value, Time Criticality, Start Date, Target Date), 'Deployment' (with instructions on how to track releases), 'Development' (with instructions on how to link an Azure Repos commit or pull request), and 'Related Work' (with an 'Add link' button). The top of the page shows the 'Weather App' team context and a search bar.

2.Fill in Features

The screenshot displays the Azure DevOps interface for a project named 'Weather App'. The left sidebar shows the navigation menu with options like Overview, Boards, Work items, Backlogs, Sprints, Queries, Delivery Plans, Analytics views, Repos, Pipelines, Test Plans, and Artifacts. The main area shows a 'My activity' tab with a 'Back to Work Items' link. The selected work item is a 'FEATURE 2' titled 'City Search Feature' by Lokshana Senthilkumar. The status is 'Resolved' and the area is 'Weather App'. The reason is 'Stories complete'. The description field contains a placeholder text: 'Add a comment. Use # to link a work item, @ to mention a person, or ! to link a pull request.' The right sidebar shows the 'Details' tab with sections for 'Development' (Add link), 'Related Work' (Add link), and 'Classification' (Value area: Business).

3.Fill in User Story Details

The screenshot displays the Azure DevOps interface for a project named 'Weather App'. The left sidebar shows the navigation menu with options like Overview, Boards, Work items, Backlogs, Sprints, Queries, Delivery Plans, Analytics views, Repos, Pipelines, Test Plans, and Artifacts. The main area shows a 'My activity' tab with a 'Back to Work Items' link. The selected work item is a 'USER STORY 8' titled 'view weather by city name' by Jashwanth J. The status is 'Resolved' and the area is 'Weather App'. The reason is 'Code complete and unit t'. The description field contains the text: 'As a user, I want to search weather information by entering a city name so that I can know the weather conditions of any location.' The acceptance criteria section lists several requirements: 'User is able to enter a city name in the search field', 'On clicking the search button, weather data is fetched', 'Valid city name displays weather information', 'Invalid or empty city name shows an error message', and 'Weather data loads within 3 seconds'. The right sidebar shows the 'Details' tab with sections for 'Deployment' (To track releases associated with this work item, go to Releases and turn on deployment status reporting for Boards in your pipeline's Options menu. Learn more about deployment status reporting), 'Development' (Add link), and 'Related Work' (Add link).

Result:

Thus, the creation of epics, features, user story and task has been created successfully.

EXP NO: 4	SPRINT PLANNING
-----------	-----------------

Aim:

To assign user story to specific sprint for the Weather App.

Sprint Planning

Sprint 1

The screenshot shows a Jira Sprint Planning board for the 'Weather App Team'. The board is titled 'Weather App Team' with a dropdown arrow, a star icon, and a group icon. Below the title are tabs for 'Taskboard', 'Backlog', 'Capacity', and 'Analytics'. The 'Taskboard' tab is selected. Below the tabs are two filters: 'Sprint 1 - Basic Weather Functionality' and 'Person: All'. The board is divided into three columns: 'Collapse all', 'New', and 'Active'. The 'New' column contains three user stories, each with a dropdown arrow to its right.

Story ID	Story Title	Assignee	Status
8	view weather by city name	Jashwanth J	New
9	View current weather details	Jashwanth J	New
12	Handle invalid city input	jothi shree	New

Sprint 2

Sprint 3

Result:

The Sprints are created for the Weather App.

EXP NO: 5

POKER ESTIMATION

Aim:

Create Poker Estimation for the user stories – Weather App Project.

Poker Estimation

The screenshot displays the Azure DevOps interface for a project named 'Weather App'. The left sidebar shows the navigation menu with options like Overview, Boards, Work items, Backlogs, Sprints, Queries, Delivery Plans, Analytics views, Repos, Pipelines, Test Plans, and Artifacts. The main area shows a user story titled 'view weather by city name' with a story point of 3. The story is in the 'Resolved' state and is part of the 'Weather App/Sprint 1 - Basic Weather Functionality' iteration. The description of the story is: 'As a user, I want to search weather information by entering a city name so that I can know the weather conditions of any location.' The acceptance criteria are listed as follows:

- User is able to enter a city name in the search field
- On clicking the search button, weather data is fetched
- Valid city name displays weather information
- Invalid or empty city name shows an error message
- Weather data loads within 3 seconds

The right sidebar shows the 'Deployment' section with a link to 'Releases' and a 'Development' section with a link to 'Add link'. The bottom of the interface shows a 'Discussion' section with a comment box.

Result:

The Estimation/Story Points is created for the project using Poker Estimation.

EXP NO: 6	DESIGNING CLASS AND SEQUENCE DIAGRAMS FOR PROJECT ARCHITECTURE
------------------	---

Aim:

To Design a Class Diagram and Sequence Diagram for the given Project.

6A. Class Diagram

The Architecture Diagram and ER Diagram is designed Successfully for the Weather App.

EXP NO: 8	TESTING – TEST PLANS AND TEST CASES
------------------	--

Aim:

Test Plans and Test Case and write two test cases for at least five user stories showcasing the happy path and error scenarios in azure DevOps platform.

Test Planning and Test Case

Test Case Design Procedure

1. Understand Core Features of the Application

- User Location Detection (GPS / Manual city search)
- Viewing Current Weather Conditions
- 7-Day / Hourly Weather Forecast
- Search Weather by City
- Error Handling (invalid city, no internet, API failure)

2. Define User Interactions

- Each test case represents real user behaviour such as: Searching for a city's weather, Allowing location access, Viewing forecast details

3. Design Happy Path Test Cases

- Focus on validating correct system behaviour under normal conditions.
- Example: User searches a valid city and weather details are shown

4. Design Error Path Test Cases

- Validate system behaviour under invalid or unexpected conditions.
- Example: User enters invalid city name → error message shown, API failure → graceful error handling message.

5. Break Down Steps and Expected Results

- Each test case includes: Step-by-step actions (e.g., open app → enter city → click search), Expected result (e.g., weather details displayed correctly)
- Ensures clarity for manual testers and automation scripts

6. Use Clear Naming and IDs

- Test cases are uniquely identified for easy tracking: TC01 – Search Valid City Weather, TC02 – Invalid City Search Error Handling
- Helps map test cases to user stories and requirements

7. Separate Test Suites

- Test cases are grouped based on functionality: Location & Weather Display, Error Handling & Edge Cases
- Improves organization and test execution flow in Azure DevOps.

8. Prioritize and Review

- Critical user actions are marked high-priority.
- Reviewed for completeness and traceability against feature requirements.

3.Test case

Give two test cases for at least five user stories showcasing the happy path and error scenarios in azure DevOps platform.

Weather App – Test Plans

USER STORIES

- As a user, I want to search weather information by entering a city name so that I can know the weather conditions of any location.
- As a user, I want to view the current temperature, humidity, and weather condition so that I can understand the present climate.
- As a user, I want to see a 5-day weather forecast so that I can plan my future activities.
- As a user, I want the application to automatically detect my location so that I receive weather updates without manual input.
- As a user, I want to see an error message when an invalid city name is entered so that I know the input is incorrect.
- As a user, I want a simple and visually appealing interface so that the application is easy to use.

Test Suites

Test Suit: TS01 – Weather Feature Testing (ID: 16)

1. TC01 – Successful Weather Search

- **Action:**
 - Open the Weather App.
 - Enter a valid city name (e.g., Chennai).
 - Click "Search".
- **Expected Results:**
 - Weather App loads successfully.
 - City name is accepted without error.
 - Weather data is fetched from API.
 - Weather information is displayed successfully.
- **Type:** Happy Path

2. TC02 – View Current Weather Details

- **Action:**
 - Open the Weather App.
 - Search for a valid city.
 - Observe the weather details section.
- **Expected Results:**
 - Temperature is displayed correctly.
 - Humidity is shown correctly.
 - Wind speed is displayed.
 - Weather condition (e.g., Clear Sky, Broken Clouds) is shown.
- **Type:** Happy Path

3. TC03 – Display 5-Day Forecast Graph

- **Action:**
 - Open the Weather App.
 - Search for a valid city.
 - Scroll to the forecast section.
- **Expected Results:**
 - 5-day forecast bar graph is displayed.
 - Temperature values appear above each bar.
 - Weather conditions appear below each bar.
 - Graph is visually aligned and readable.
- **Type:** Happy Path

4. TC04 – Automatic Location Detection

- **Action:**
 - Open the Weather App.
 - Allow browser location permission.
 - Wait for location detection.
- **Expected Results:**
 - Browser requests location permission.
 - User location is detected successfully.
 - Weather details are displayed automatically for detected location.
- **Type:** Happy Path

5. TC05 – Invalid City Search Error

- **Action:**
 - Open the Weather App.
 - Enter an invalid city name (e.g., xyz123).
 - Click "Search".
- **Expected Results:**
 - Invalid input is processed.
 - Error message such as "City not found" is displayed.
 - Application does not crash or freeze.
- **Type:** Error Scenario

6. TC06 – User Interface Validation

- **Action:**
 - Open the Weather App.
 - Observe layout and design elements.
 - Interact with buttons and resize window.
- **Expected Results:**
 - UI loads with proper styling.
 - Buttons are clickable and responsive.

- Layout is clean and visually appealing.
- Application remains usable on resized screen.
- **Type:** UI/Usability Validation

Result:

The test plans and test cases for the user stories is created in Azure DevOps with Happy Path and Error Path

EXP NO: 9	LOAD TESTING AND PIPELINES
------------------	-----------------------------------

Aim:

To create an Azure Load Testing resource and run a load test to evaluate the performance of a target endpoint and to create and demonstrate an Azure DevOps pipeline for automating application builds, tests, and deployment.

Load Testing

Azure Load Testing:

Azure Load Testing allows you to simulate high traffic and stress tests for your web applications and APIs to understand how they perform under load. It helps identify performance bottlenecks, scalability issues, and optimize resource usage before deployment.

Steps to Create an Azure Load Testing Resource:

Before you run your first test, you need to create the Azure Load Testing resource:

1. Sign in to Azure Portal
Go to <https://portal.azure.com> and log in.
2. Create the Resource
 - Go to *Create a resource* → Search for “Azure Load Testing”.
 - Select Azure Load Testing and click Create.
3. Fill in the Configuration Details
 - *Subscription*: Choose your Azure subscription.
 - *Resource Group*: Create new or select an existing one.
 - *Name*: Provide a unique name (no special characters).
 - *Location*: Choose the region for hosting the resource.
4. (Optional) Configure tags for categorization and billing.
5. Click Review + Create, then Create.
6. Once deployment is complete, click Go to resource.

Steps to Create and Run a Load Test:

Once your resource is ready:

1. Go to your Azure Load Testing resource and click Add HTTP requests > Create.
2. Basics Tab
 - *Test Name*: Provide a unique name.
 - *Description*: (Optional) Add test purpose.
 - *Run After Creation*: Keep checked.
3. Load Settings
 - *Test URL*: Enter the target endpoint (e.g., <https://yourapi.com/products>).

4. Click Review + Create → Create to start the test.

Load Testing

Pipelines

Description:

This experiment demonstrates how to connect a GitHub-hosted Weather Application project with Azure DevOps. The pipeline is configured to integrate the project repository, validate project files, and automate basic build verification through Azure Pipelines. This ensures that project changes are tracked efficiently, supports continuous integration practices, and improves reliability and maintainability of the application throughout development.

Steps:

1. Connect GitHub to Azure DevOps:
 - In Azure DevOps, create a new project.
 - Create a pipeline and select GitHub as the source.
 - Authorize access to your GitHub repository, ensuring that Azure DevOps can pull the repository for your pipeline.
2. Create azure-pipelines.yml in Your Repo Root:
 - In your GitHub repository, create a new file called azure-pipelines.yml in the root directory.
 - Add the following basic pipeline configuration for HTML, CSS, and JavaScript-based Weather Application:

yml Code

```
# Starter pipeline
# Start with a minimal pipeline that you can customize to build and deploy your code.
# Add steps that build, run tests, deploy, and more:
# https://aka.ms/yaml
```

```
trigger:
```

```
- main
```

```
pool:
```

```
  vmImage: 'ubuntu-latest'
```

```
steps:
```

```
- script: echo "Weather App Build Successful!"
  displayName: 'Run a simple build check'
```

```
- script: |
  echo "Checking files..."
  ls
  displayName: 'List project files'
```

3. Pipeline Tasks Include:

- Setting up the pipeline environment using the default Azure-hosted agent (ubuntu-latest).
- Validating the Weather Application project files stored in the repository.
- Running a simple build verification script to ensure the pipeline is configured correctly.
- Listing project files to confirm successful repository integration and pipeline execution.

4. Run and Monitor Pipeline:

- Commit changes to the main branch of your repository to trigger the pipeline in Azure DevOps.
- Monitor the pipeline execution logs in the Azure DevOps portal to verify build steps, detect errors, and confirm successful execution of the configured tasks.

Pipeline

The screenshot displays the Azure DevOps pipeline interface for a build named "#20260418.1 • Set up CI with Azure Pipelines" for the "Weather App" project. The build status is "Succeeded" (indicated by a green checkmark). A message states: "This run is being retained as one of 3 recent runs by main (Branch)." with a link to "View retention leases".

The interface includes tabs for "Summary" and "Code Coverage". The "Summary" tab is active, showing details about the build:

- Individual CI by** Lokshana Senthilkumar
- Repository and version:** Weather App, main, de85d50d
- Time started and elapsed:** 19 Apr at 00:31, 7s
- Related:** 0 work items, 0 artifacts
- Tests and coverage:** Get started
- View 3 changes** and **Parameters** buttons.

Below the summary, there are tabs for "Stages" and "Jobs". The "Stages" tab is active, showing a single stage named "Stage" with a green checkmark, indicating it is completed. The stage summary shows "1 job completed" and a duration of "6s". Below the stage summary, there is a "Job" summary showing "2s" and a "Rerun Stage" button.

GITHUB: PROJECT STRUCTURE & NAMING CONVENTIONS

Aim:

To provide a clear and organized view of the project's folder structure and file naming conventions, helping contributors and users easily understand, navigate, and extend the Weather App project.

GitHub Project Structure

Result:

The GitHub repository clearly displays the organized project structure and consistent naming conventions, making it easy for users and contributors to understand and navigate the codebase.
